

(a) final profiles at the common time $T = 19.2$

(b) convergence, and where it saturates

Fisher-Kolmogorov on $[-1, 1]$, $\alpha = 2$, $d = 0.0002$, 200 P1 elements, backward Euler with Newton; all six runs stopped at $T = 19.2$, the largest time divisible by every step tested.

In (b) each measure is divided by its own reference value, so all three are dimensionless and may share one axis; p is the slope through $\Delta t = 0.05$ and 0.1 only.

A front that has left the interval is censored at the domain end $x = 1$, so the three open diamonds are lower bounds and not measured front positions.
